## **Preface**

This study reports the air pollution vulnerability mapping of Lahore city and provides information about the vulnerability levels of air pollutants at various places of Lahore. The air quality monitoring activities have been carried out at five places of Lahore and each location is monitored for six air pollutants which are carbon monoxide, sulphur dioxide, nitrogen dioxide, hydrogen sulphide, ammonia and chlorine by a reagent absorption method. The sources and concentrations have been discussed. The data obtained from sampling at various commercial and residential sites is compared against the past year data and the comparison graphs are plotted to show the trend of these air pollutant. The spatial patterns of monthly mean precipitation and monthly mean temperature have been studied. A public survey has been conducted that shows the public awareness in regard to basic information regarding air pollution. In the end some conclusions and recommendations are given for the purpose to maintain a healthy environment for our citizens, support the strategies, to maintain energy independence and promote an effective role in formulating the environmental policies.

# Contents:

Preface .....	i
Contents:.....	iii
Chapter 1: Introduction .....	1
1.1 Study area .....	2
1.2 Climatological Conditions.....	4
1.2.1 Spatial Patterns of Precipitation in the Punjab Province .....	4
1.2.2 Spatial Patterns of Temperature in the Punjab Province .....	19
1.2.3 Humidity .....	33
1.2.4 Wind Direction.....	33
1.3 Population Growth of Lahore.....	33
1.4 Existing Land Use .....	34
1.5 Air pollution definition.....	36
1.6 Common air pollutants .....	37
1.7 Major sources of air pollution .....	37
1.8 Concerns to air pollution .....	38
1.8.1 Should we not worry about air pollution .....	38
1.9 An insight into Int'l (Asian) air pollution levels.....	38
1.9.1 Air pollution in China.....	39
1.9.2 Air pollution in India .....	40
1.9.3 Air pollution in Indonesia.....	40
1.9.4 Air pollution in Hong Kong.....	40
1.10 The role of International Cooperation.....	41
Chapter 2: Classification, sources and effects.....	43
2.1 Type A: Classification.....	43
2.1.1 Natural sources (primary and secondary pollutants).....	43
2.1.2 Manmade sources .....	44
2.2 Type B: Classification .....	44
2.2.1 Point sources .....	44
2.2.2 Line sources .....	45
2.2.3 Area / volume sources .....	45
2.3 Sulphur containing compounds.....	45
2.3.1 Sulphur dioxide.....	45
2.3.2 Sulphur trioxide .....	46
2.3.3 Hydrogen sulphide.....	46
2.4 Nitrogen containing compounds .....	47
2.4.1 Nitrous oxide .....	47
2.4.2 Nitric oxide .....	47

2.4.3	Nitrogen dioxide .....	47
2.5	Carbon containing compounds.....	48
2.5.1	Carbon monoxide.....	48
2.5.2	Carbon dioxide.....	49
2.6	Residential (indoor) air pollution sources .....	50
2.7	Effects of air pollution.....	51
2.7.1	Effects of air pollution on atmospheric properties .....	51
2.7.2	Effects of air pollution on human health .....	52
2.7.3	Airborne diseases.....	54
2.7.4	Air pollution effects on the materials .....	55
2.8	Effects on plants .....	56
2.9	Types of plants in Lahore.....	57
2.9.1	Roadside Plants.....	57
2.9.2	Ediphytes and Chasmophytes.....	58
2.10	Sensitivity of the plants to air pollution .....	59
2.10.1	Damage to Leaf Structure.....	59
2.10.2	Delayed Flowering.....	59
2.10.3	Root Damage .....	60
2.11	Residence time of air pollutants .....	60
Chapter 3: Methods .....		63
3.1	The air pollution monitoring unit .....	63
3.1.1	Equipment requirement .....	63
3.1.2	Selection of a sample site .....	64
3.1.3	Setting the sampling point .....	65
3.2	Objectives and scope of the kit fabrication program .....	65
3.3	The air pollution monitoring unit .....	65
3.3.1	Monitoring parameters.....	67
3.3.2	The air pump.....	67
3.1.3	Air pollution monitoring setup .....	68
3.3.4	Plastic and glassware .....	68
3.3.5	Composition of reagents for detecting gases.....	68
3.4	Procedure for air pollution analysis: .....	70
3.4.1	Carbon monoxide.....	70
3.4.2	Nitrogen dioxide .....	71
3.4.3	Sulphur dioxide.....	72
3.4.4	Hydrogen sulphide.....	73
3.4.5	Ammonia .....	74
3.4.6	Chlorine .....	75
3.5	Precautions .....	76
3.5.1	The air pump:.....	76
3.5.2	The monitoring unit: .....	76
3.6	Troubleshooting.....	77
3.7	Visual comparators.....	77

Chapter 4: Air pollution sampling and analysis.....	81
4.1    Importance of monitoring air pollution.....	81
4.2    Importance of data acquisition and analysis .....	82
4.3    Exposure level study procedure .....	84
4.3.1    Human exposure studies.....	84
4.3.2    Laboratory research / animal studies.....	84
4.3.3    Epidemiological studies.....	85
4.4    WHO concentration thresholds .....	85
4.5    Atmospheric concentration units.....	86
4.6    Air pollution at Badami Bagh .....	87
4.6.1    Map of the sampling site.....	87
4.6.2    Data acquisition and plotting .....	88
4.6.3    Interpretation and trend analysis.....	91
4.7    Air pollution at Ichhra Market .....	92
4.7.1    Map of the sampling site.....	92
4.7.2    Data acquisition and plotting .....	93
4.7.3    Interpretation and trend analysis.....	96
4.8    Air pollution at Main Market Gulberg.....	97
4.8.1    Map of the sampling site.....	97
4.8.2    Data acquisition and plotting .....	98
4.8.3    Interpretation and trend analysis.....	101
4.9    Air pollution at Railway Station.....	102
4.9.1    Map of the sampling site.....	102
4.9.2    Data acquisition and plotting .....	103
4.9.3    Interpretation and trend analysis.....	106
4.10    Air pollution at Shadman Market.....	107
4.10.1    Map of the sampling site.....	107
4.10.2    Data acquisition and plotting.....	108
4.10.3    Interpretation and trend analysis.....	111
4.11    Peak concentrations (in ppm).....	112
4.11.1    Interpretation and trend analysis.....	115
4.12    Mean concentrations (in ppm).....	116
4.12.1    Mean of past pollutant concentrations (in ppm).....	117
4.12.2    Interpretation and trend analysis.....	121
4.12.3    Interpretation and inter-comparison .....	122
4.13    Lahore city averages (in ppm).....	123
4.13.1    Interpretation and trend analysis.....	124
Chapter 5: Air pollution control.....	125
5.1    Gaseous pollution control methods .....	125
5.1.1    Absorption and adsorption towers.....	125
5.1.2    Combustion.....	126
5.2    Particulate pollution control methods .....	126
5.2.1    Settling chamber .....	127

5.2.2	Cyclone separator .....	128
5.2.3	Wet collectors (Scrubbers) .....	129
5.2.4	Bag filters.....	132
5.2.5	Electrostatic precipitators .....	132
Chapter 6: Public survey, conclusions and recommendations.....		135
6.1	Public survey .....	135
6.2	Conclusions and recommendations.....	143
Bibliography.....		151

# Chapter 1: Introduction

Air pollution is an increasingly important environmental problem in the world. Emissions of sulphur dioxide, nitrogen oxides and ammonia have been rising steadily over the past few decades.

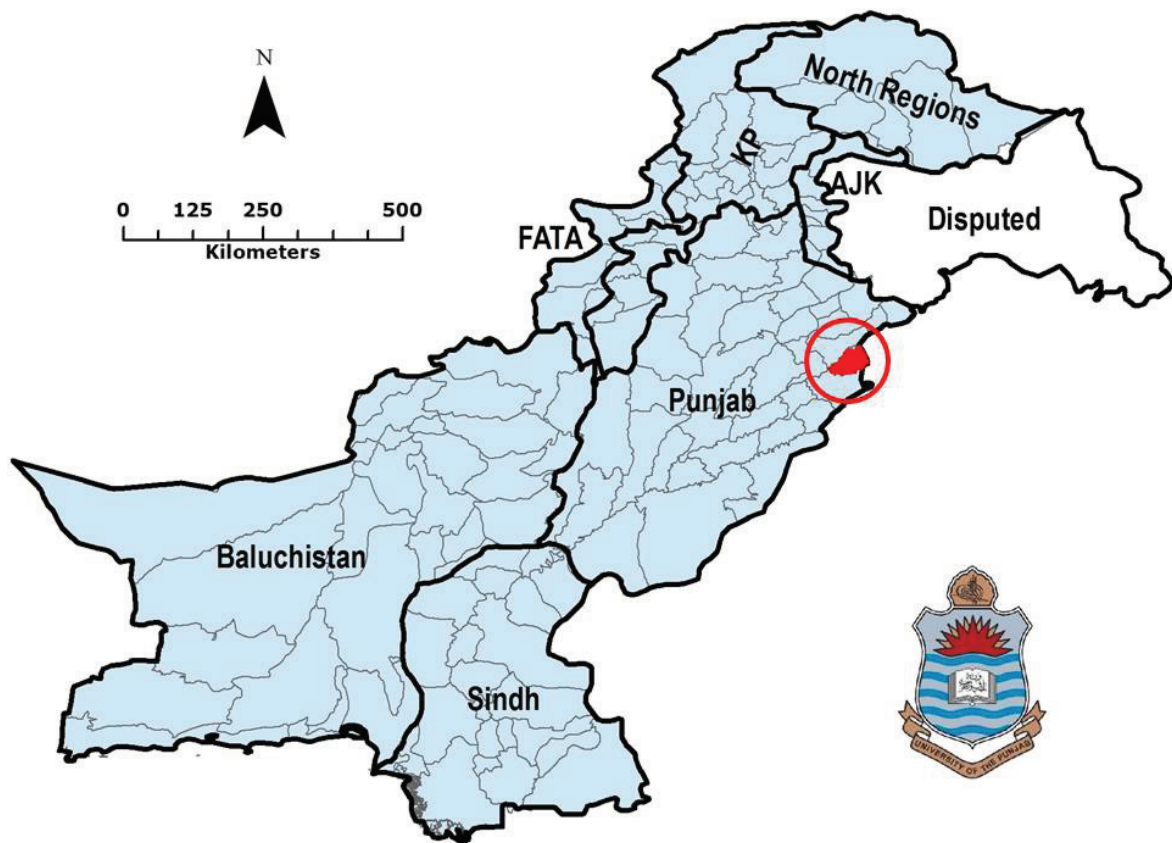

Figure 1.1: Location of the study area (Lahore City) is shown in red circle

Projections indicate that potentially large increases in emissions may occur during the next twenty to fifty years if current development patterns persist. If these occur, the impacts that have been experienced in Europe over this century will become increasingly prominent in large parts of Asia over the next century. As an initiative to facilitate the development of action plans, strategies and policies for pollution prevention and control, many countries are funding many programs on atmospheric and environmental issues in developing countries.

## 1.1 Study area

Lahore is a typical inland city of Pakistan. As shown in Figure 1.1, this land locked city is situated about 1100 kilometres away from the Arabian Sea.

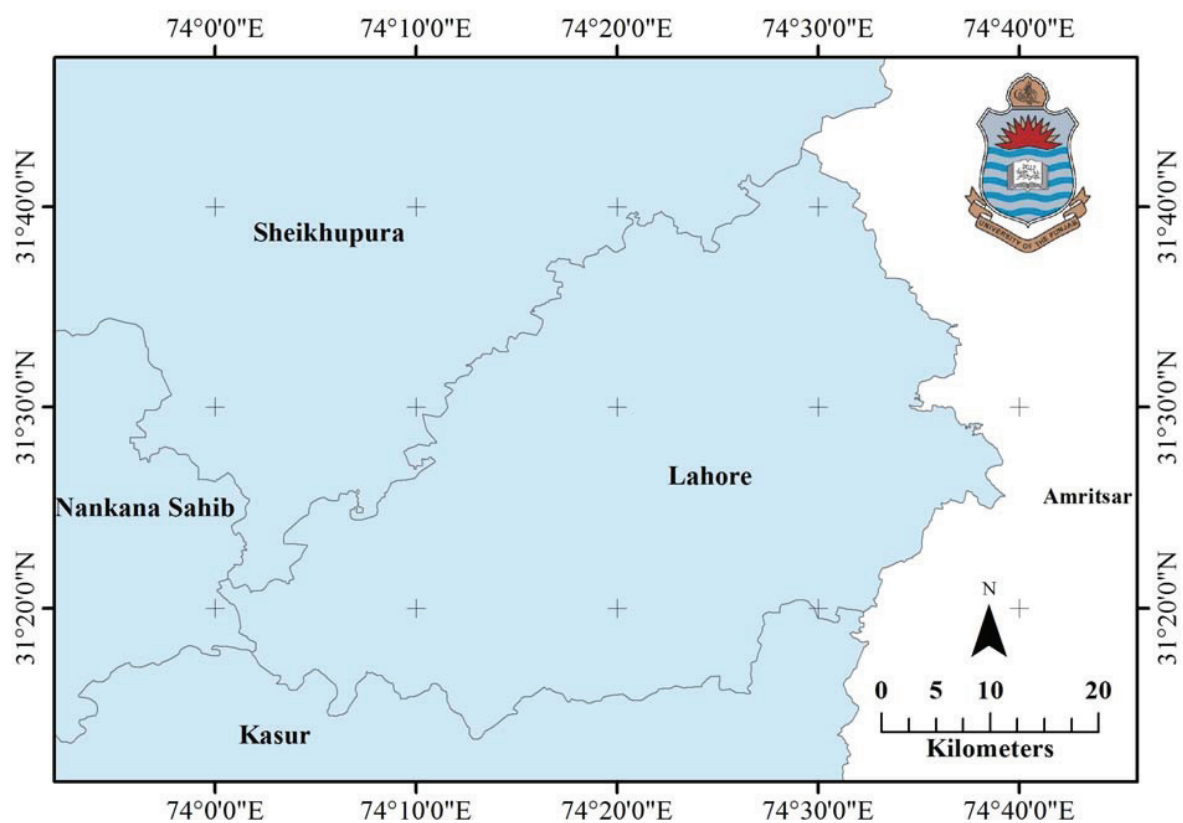

Figure 1.2: Geographical Location of Lahore City

The geographical location of Lahore is from  $31^{\circ} 13' 28''$  N to  $31^{\circ} 43' 02''$  N in latitude and  $74^{\circ} 00' 00''$  E to  $74^{\circ} 39' 05''$  E in longitude. Situated along the South bank of River Ravi, the city is bounded by Sheikhupura district in the North and Kasur District in the South. The east of Lahore city is the International Boundary Line separating Pakistani Punjab from Indian Punjab. The adjoining city on the Indian side is Amritsar (Ajnala, Tarn Taran and Patti) as shown in Figure 1.2. With a total area of 1,772 square kilometres, the Lahore city is the provincial capital of Punjab and its large area comprises of urban settlements as shown in Figure 1.3.

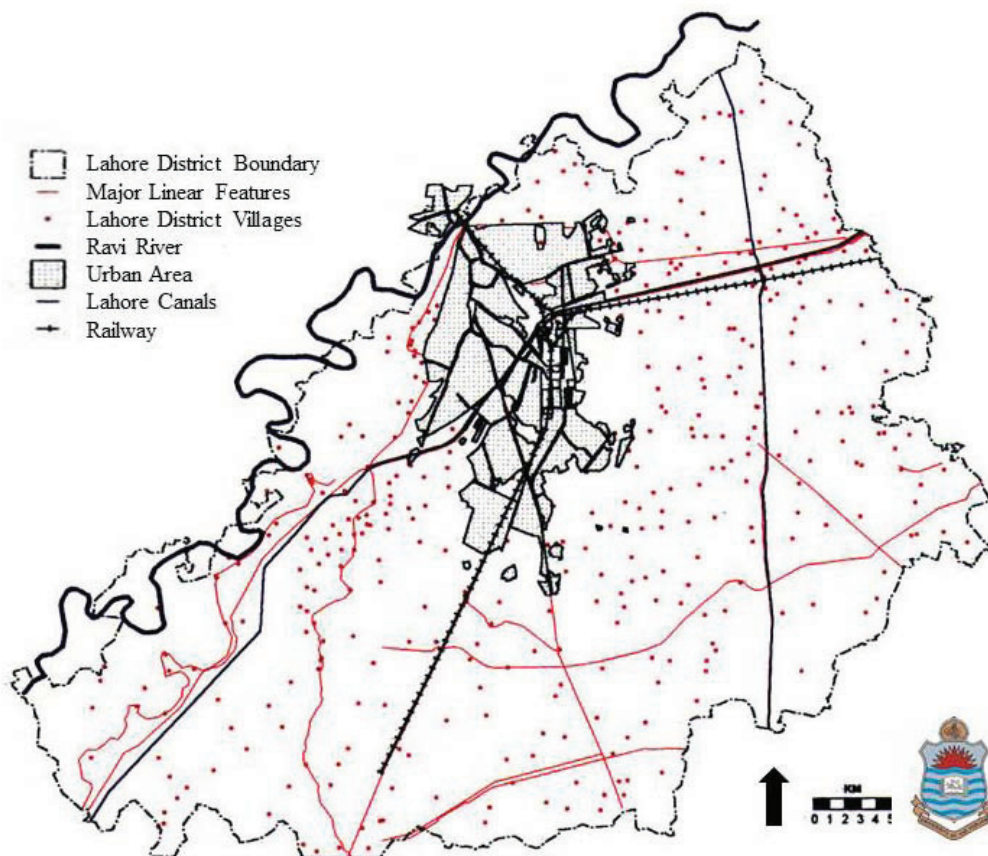

Figure 1.3: Urban area of Lahore district (Isma, 2000)

Lahore occupies a fertile alluvial plain formed by the deposits of the river Ravi and Sutlej and their tributaries. The river flows along the north-western boundary of

the city, and its seasonal floods have inhabited the city's growth towards the North and Northwest.

## **1.2 Climatological Conditions**

Climatically, the city of Lahore experiences three seasons, cold, hot, and rainy. Winter season extends from mid-November to the mid-February. In this season the cold sunny days are alternated with cloudy rainy days. Rainy days are usually followed by clear days with frost at night in the countryside. Early morning and evening mist is also common.

The winter rain usually stops by the end of February but sometimes continue through March. The monsoon burst over Lahore sometimes in the mid of the June or the last week of the June. It usually results in the heavy downpour and the showers continue with the short intervals till September.

### **1.2.1 Spatial Patterns of Precipitation in the Punjab Province**

Most of the rainfall in Lahore occurs in the monsoon months. The monsoons are at their peak in July. In the rainy season, it is pleasant, but during the day following rains, the still air, high temperature, and high humidity create a condition of extreme discomfort. On the average there is no month without rainfall in Lahore. The driest months are October and November, which together receive on an average 0.34 inches of the rainfall. From December to March is the season of winter rains, which the entire four months period receive 3.72 inches of rainfall an amount although meagre, but of great importance for its value to agriculture and the weather. April and May receive rainfall either through western disturbances or locally generated thunderstorms. May to October account for only about 25% of the annual rainfall. The remaining 75% takes place in the monsoon season.

The monsoons are at their peak during July and August. On the average July is the month of the maximum and November is of minimum rainfall. The most intensive recorded cloudburst in Lahore occurred on September 24, 1954 which about 9 inches rainfall in 24 hours. Such cloudbursts seriously affect the daily life of the city by flooding the low-lying areas due to inadequate drainage system. The heaviest rainfall on Lahore occurred in the 1882 when recorded 37.43 inches of rainfall was recorded. The driest year was 1899 when only 6.21 inches of rainfall.

Here the data from WorldClim database has been used to identify the estimates of the spatial patterns of precipitation in the Punjab province. As the WorldClim data grids are of 1 kilometres resolution, a small city may contain only a few pixels. In order to better visualize the patterns it is important to consider / map a larger area. Therefore, the precipitation maps have been prepared on the province level scale.

The WorldClim database is based on the data interpolated over the larger areas (near global) from obtained from the multiple weather stations (WMO) during the period 1960-90. The resampled SRTM digital elevation model data at a resolution of 1 kilometre has been used for spline interpolating the point data over the larger spatial surfaces.

Traditionally the units for the measurement of rainfall are mm (millimetre) which is the amount of rain per square meter in one hour. The amount of 1mm of rainfall means one litre of water in a square meter area. The unit used for the precipitation values here is in mm equivalent of rainfall.

The maps of rainfall in the Punjab province indicate heavy rainfalls in the northern part which is adjacent to the mountainous northern areas of Pakistan comprising of State of Azad Jammu and Kashmir (AJK), North West Frontier Province (NWFP), and Shumali Ilaqajat. The southern parts of Punjab receive very little rainfall.

The rainfall values presented here comprise of modelled data and may contain inaccuracies and/ or over-estimations. The values of monthly cumulative precipitation averaged for 1060-90 period (lowest and highest values of rainfall in the Punjab province) are summarized in the following table.

<b>Month</b>	<b>Monthly Rainfall (lowest value in Punjab) in mm</b>	<b>Monthly Rainfall (highest value in Punjab) in mm</b>
January	2	109
February	2	112
March	3	137
April	1	112
May	1	83
June	4	107
July	23	255
August	24	255
September	8	179
October	0	55
November	0	29
December	2	47
